ALIGNMENTS

AAB11488 standard; protein; 323 AA. (first entry) 02-MAR-2001 AAB11488; AAB11488 RESULT

Wheat chitinase protein homologous to rye chitinase.

Wheat; chitinase; low temperature expression; hardened; plant; snow mould resistance; psychophilic plant pathogen; rye.

Triticum aestivum

New low temperature expression chitinase gene for producing a plant grade highly resistant to psychophilic plant pathogenic microbes $\,$

Claim 4; Fig 2; 11pp; Japanese.

This invention describes novel wheat chitinase genes. The invention also describes a method for the isolation of a low temperature expression

The invention also describes a method for the isolation of a low temperature expression chitinase gene in which the mRNA is extracted from a fully hardened autumn wheat PII73438 (of high snow mould resistance). The genes are
chitinase gene in which the mRNA is extracted from a fully hardened autumn wheat PII73438 (of high snow mould resistance). The genes are useful for creating a plant grade, highly resistant to psychophilic plant pathogenic microbes.
                                                                                                                                                                                                                                           240

```

Secale cereale.

```
The present sequence is winter rye (Secale cereal L. cv. Muskateer)
CHT9 preprotein. The mature protein, which is also claimed, is a
chitimese like protein that has chitimese (antifungal) and
antifreeze activities. CHT9 cDNA (see AAXX4889) was obtained by
isolating mRNA from rye plants grown at low temperatures in the
sheence of pathogens or other stresses, i.e. under conditions when
con protein and peast (First) have been cloned and expressed. CHT9
and CHT46 (see AAW98081-82) have been cloned and expressed in
confly chitimases with antifreeze activity would be expressed in
the chitimase-like antifreeze proteins can be used: to increase
freezing tolerance of plants and microorganisms; to increase field
survival of plants, animals and microorganisms exposed to sub-zero
temperatures; to inhibit ace recrystallisation in blological
materials or foods; for cryopreservation and hypothermic protection
of cells, embryos, tissues etc. (particularly human platelets); and
co kell; tumour cells. They are also used to inhibit initiation and
progression of diseases or spoilage caused by low temperature
cryopreserved biological meterial. The signal peptide can be used
cryopreserved biological meterial. The signal peptide can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           -----GGGGVASIVSRDLFERFLLHRNDAACLARGFYTYDAFLAAAGAFPAFGTTGD 123

```
The present sequence is winter rye (Secale cereal L. cv. Muskateer)

CHT9 mature protein. It lacks the 20-amino acid signal peptide

of the preprotein (see AAM98079), which is also claimed. Mature CHT9

is a chitinase-like protein that has chitinase (antifungal) and

antifreeze activities. CHT9 preprotein cDNA (see AAX24869) was

cobtained by isolating mRNA from rye plants grown at low temperatures

in the absence of pathogens or other stresses, i.e. under conditions

when only chitinases with antifreeze activity would be expressed.

CHT9 and CHT46 (see AAW98081-82) have been cloned and expressed.

CHT9 and CHT46 (see AAW98081-82) have been cloned and expressed in a bacterial and yeast (Pichia) systems and in Arabidopsis thaliana.

The chitinase-like antifreeze proteins can be used: to increase field survival of plants, animals and microorganisms stopsed to sub-zero temperatures; to inhibit ice recrystallisation in biological

materials or foods; for cryopreservation and hypothermic protection

of cells, embryos, tissues etc. (particularly human platelets); and

to kill tumour cells. They are also used to inhibit initiation and

progression of diseases or spollage caused by low temperature

cryopreserved biological material.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       140 HETTGGWPTAPDGPFSWGYCFKQEQGSPPSYCDQSADWPCAPGKQYYGRGPIQLTHNYNY 199

                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence given is encoded by the rice chitinase gene. The promoter region of this gene (see AAQ11407) is responsive to physical and/or biological stress. The pattern of expression of this protein in mature plants is characteristic. There is a low level of expression in autre laves, a moderate level in plant stems and the highest level in roots and the male and female parts of the plant. The chitinase promoter sequence may be linked to a reporter gene for expression in mono- or dicotyledon plants. Expression of this reporter gene may be used to study patterns of development and controlled expression of plant defence genes and selectable genes.

The specification describes chimeric receptors which are used for modulating plant responses to pathogens. The receptors comprise a heterologous extracellular domain (e.g. from a Bril protein or RCH10 protein) and a kinase domain (e.g. from disease resistance protein Xall) rice Xall gene is a member of disease resistance protein Xall. The Xall when Xall is present in a transgenic plant, it confers resistance to Amathomonas spp. The plant receptors containing heterologous domains are useful for modulating plant responses to pathogens including viruses, bacteria, nematodes, fungi or insects. The nucleic acids can be used to confer desired traits on essentially any plant.
                                                                                                                                                                                                                                                                                                                                                                    Disease resistance protein; Xa21; RKK gene; transgenic plant; chitinase; Xanthomonas; plant pathogen; Bril protein; RCH10 protein.

                                                                                                           This sequence represents an intracellular chitinase which is used to construct a transgenic plant in a novel method to produce plants resistant to fungal attack. Such transgenic plants expressing an intracellular plant chitinase gene and a plant beta-1,3-glucanase gene within its tissues are predicted to exhibit improved resistance to pathogenic fungi. Such genes should be operably linked to promoters and terminators and optionally a gene encoding a selectable or screenable trait. Plants that overexpress the chitinase and glucanase genes exhibit a synergistic antifungal effect.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      245 VITGLWIPTARDSAAGRVPGYGVITNVINGGIECGMGQNDKVADRIGFYRRYCDIFGIGY 304

                                                                                                                                                                                                                                                                                               The present sequence represents an extracellular chitinase. The specification describes transgenic plants which express a chitinase gene and a glucanase gene. The expression of the chitinase and beta-1, 3-glucanase genes produces an antifungal effect. The transgenic plants are useful for improving plant resistance to pathogenic fungi. The recombinant polynucleotides and the process are useful for producing fungal resistant plants.
                                                                                                                                                                                                      New transgenic plants expressing chitinase and glucanase have improved resistance against pathogenic fungi, particularly against Alternaria alternata or Fusarium oxysporum f. sp. lycopersici
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           YYGRGPIQLTHNYNYGPAGRAIGVDLLNNPDLVATDPTVAFKTAIWFWMTTQSNKPSCHD 244

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents the pumpkin chitinase. Chitinase is an enzyme decomposing chitin (not present in plant cell membranes) found in the cell membranes of fungi. Plants have this enzyme to protect themselves from pathogenic fungi. Plants have this enzyme to protect themselves from being infected with pathogenic fungi, and the chitinase gene can be introduced into plants to improve their resistance to diseases caused by fungi. As the amino acid sequence of the chitinase does not have any region to be cleaved by ubiquitous peptidases in cells, the chitinase produced by genetic recombination technology works for various host cells and serves for plant immunity to confer disease resistance on plants as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This recombinant tobacco chitinase gene prod. is encoded by a genomic clone, lambda CHN17 which comprises 3 exons and has 5'- and 3'- untranslated regions. A fragment (claimed) from the 5'-untranslated regions. A fragment (claimed) from pression of foreign genes in transgenic plants. The fragment is linked to a foreign gene, eg chitinase or glucanase gene via a spacer and is also linked to regulatory sequences. The resultant DNA construct is used to transform plant cells, eg tomato or tobacco, which subsequently produce the gene prod.

This protein inhibits the fungus Ophiostoma ulmi, the causative agent of dutch elm disease. The clone pHS2 may be used to transform E. coli cells for the recombinant production of the chitinase-like protein. The protein may be used in a composition to inhibit fungal infection of elm trees.

```

```
The inventors claim a new recombinant gene which codes for a protein with encochitinase activity, or its precursor (see AAQ21007). The coding part of the gene contains at least the 5' part of DNA for tomato enzyme (DNA can be genomic or cDNA, but at least one intron is prefigresent). The recombinant gene includes the 35s promoter of cauliflower mosaic virus plus the terminator from the nopaline synthase gene of Agrobacterium tumefaciens.
                                                                                                       Pest-resistant plant; transformed plant; fungi; insect; bacteria;
                                                                                                                                                                                                                                                                                                                                                                                                                     New recombinant protein with endo chitinase activity - also encoding it and plants which express it, resistant to fungi, insects, bacteria and nematodes.
                                                                                                                                                                                                                                                                                                                                                                 Toppan A;
